1.Reported Issue

Description

A customer has described a problem in which a remote connect or remote disconnect activity fails with a system error. The error is caused by the head end system returning none of the critical information required by the process, but such an error should not be catastrophic to the activity.

Solution Design

The Evaluate Response lifecycle state of the D7-ConnectDisconnectResultDR is the correct place to check the head end system's response and mitigate any errors. This particular error could potentially be fixed by a simple retry of the "Get Results" communication. However, the Evaluate Response state only transitions to the Create Completion Events and Discarded states. The state should be modified to allow also transitions to the Response Error state. Then, the D7-EVLCDRESP script should check for missing elements in the response. When missing elements are discovered, it should create a log message and transition the BO instance to Response Error.

Because the D7-MeterReadResultsInterval, D7-MeterReadResultsScalar, and D7-PingResultsDR BOs are similarly structured, they should also be updated to allow Evaluate Response to transition to Response Error. Since the head end is not expected to truncate the results from these commands, no script modifications are required for these BOs.

Summary

Change Type	Y/N
Does this fix require any Admin (Soft) Table Changes to be made by the client?	N
Does this fix require upgrade data changes to be applied?	N
Does the fix involve DB Changes?	N
Is there an impact on any user interface or any other on-line behavior?	Y
Is there an impact on any batch process?	N
Is there an impact on CM – Custom Modification processing?	N
Does this fix require an application viewer update for Algorithm data (run F1-AVALG)?	N
Does this fix require an application viewer update for MO data (run F1-AVMO)?	N
Does this fix require an application viewer update for Table data (run F1-AVTBL)?	N

Business Objects

D7-ConnectDisconnectResultDR – SSN - Connect Disconnect Results (Existing)

Lifecycle State: Evaluate Response

Add Next Status:

Next Status	Description	Transition Role	Transition Condition	Sequence
RESPERROR	Response Error	System	Error	12

D7-MeterReadResultsInterval – SSN - Meter Read Results (Interval) (Existing)

Lifecycle State: Evaluate Response

Add Next Status:

Next Status	Description	Transition Role	Transition Condition	Sequence
RESPERROR	Response Error	System	Error	12

D7-MeterReadResultsScalar – SSN - Meter Read Results (Scalar) (Existing)

Lifecycle State: Evaluate Response

Add Next Status:

Next Status	Description	Transition Role	Transition Condition	Sequence
RESPERROR	Response Error	System	Error	12

D7-PingResultsDR – SSN - Ping Results (Existing)

Lifecycle State: Evaluate Response

Add Next Status:

Next Status	Description	Transition Role	Transition Condition	Sequence
RESPERROR	Response Error	System	Error	12

Messages

Category 11807 / Message 10504 (New)

Received incomplete results element from head end system

Scripts

D7-EVLCDRESP – SSN - Evaluate Provisioning Response from head-end (Existing)

In Step 20, add a block to check for missing elements in the response from the server. If missing events are discovered, log an exception and transition the BO to the error state:

Add to Step 20:

```
if
("count(bo_schema/responseDetail/responseEnvelope/RemoteProvisioningResults/RemoteProvisioningRes
ult/RequestedProvisioningAction) = 0")
            // Create Log entry:  Received incomplete results element from head end system
            move 'D1-COMMOUT' to  "F1-AddMOLog/mo";
            move "bo_schema/communicationId" to "F1-AddMOLog/pkValue1";
            move 'F1EX' to "F1-AddMOLog/logEntryType";
            move '11807' to "F1-AddMOLog/messageCategory";
            move '10504' to "F1-AddMOLog/messageNumber";
            move "bo_schema/communicationId" to "F1-AddMOLog/fkValue1";

            invokeBS 'F1-AddMOLog'  using "F1-AddMOLog";
            move 'F1ER' to "parm/hard/nextStatusCondition";
            terminate;
     end-if;
```

Impact On Other Business Processes & Configuration

Impact on Online Behavior

In the rare instances in which the Get Remote Provisioning Results By Job ID web service returns truncated data, the system will respond with a log message and transitioning the BO to Response Error. From there, the communication can be retried according to normal retry rules.

Verification

Visual Confirmation

Ensure the changes to the objects above are present in the system.

Test Connect or Disconnect Activity

1) Configure External System, Head End System, Processing Methods, and one or more Devices for sending the SGG commands Remote Connect or Remote Disconnect using the SSN Adapter. Place the device's install event in a state appropriate for the desired command (e.g. if running Remote Connect, set the install event to commissioned/disconnected).

2) If using the sgg-harness, select an AMI Device Identifier that corresponds to a Device Identifier ending in "EMP". This will enable the sgg-harness to respond in a similar way to the head end's data truncation.

3) Initiate a new Remote Connect or Remote Disconnect Activity. Allow it to process to completion. If necessary, use batch processes or manual action to perform all necessary polling. Confirm the initial outbound communication and all job status polling requests complete successfully.

4) Verify the Get Connect/Disconnect Results outbound communication (D7-ConnectDisconnectResultDR BO) is in the Response Error state.

5) Navigate to the Get Connect/Disconnect Results outbound communication's Log tab. Verify an exception log message stating "Received incomplete results element from head end system."
