Description
Steps To Recreate

Description

Groovy script uses concatenateGroovyStrings to build a query, assigns it to a variable, reassigns to a second variable, and passes that to createPreparedStatement. Saving succeeds.

e.g.:
```
def str = concatenateGroovyStrings("select * ", "from dual");
def newStr = str;
def query = createPreparedStatement(newStr, "comment");
```

After modifying the script to append an additional string during reassignment, a warning appears on save. Clicking OK on the message resulting in saving it. It should leads to an error and the script should not be saved.

e.g.:
```
def str = concatenateGroovyStrings("select * ", "from dual");
def newStr = str + " where 1 = 1";
def query = createPreparedStatement(newStr, "comment");
```

Steps To Recreate

1) Open script portal and create a new groovy script using new function concatenateGroovyStrings.
2) Assign its output to a variable, then reassign this value to a second variable.
3) Use the second variable in the createPreparedStatement method. Save the script. The script should save successfully.
4) Modify the script by concatenating an additional string to the original variable when assigning it to the second variable.
5) Save the script. A warning popup will appear if the user clicks OK and attempts to save.

Expected: This should result in an error and the script should not be saved.
Actual: Script is getting saved.
