Reported Issue

Description

When performing a **Rate Check** on a newly created **Bill Segment**, a ***"System Error, please see logs for more details"*** message is displayed under the **Results tab** in the **Read Details zone**. The error occurs when the **Rate Check** process runs and attempts to display or persist read-related data (including **Service Quantity Identifier** values such as ***DAYS SQI***). The issue impacts users who rely on **Rate Check** with **Bill Segments** in environments where the system is configured to allow **Service Quantity Identifiers** with up to eight decimal places for internal computation.

Steps To Recreate

1. Go **Feature Configuration** and search for **Financial Transaction Options** (***C2M-FTOPTION***).

Feature Configuration Search

2. Set the feature option "***Allow Eight Decimals on SQI for Internal Computation***" to ***Y***.

Feature Configuration: ZZFT Financial Transaction Options

Copyright ©2026, Oracle. All rights reserved.

3. Create or select a **Bill Segment** suitable for **Rate Check**.

Bill Segment: 242636340300

4. Select the **Rate Schedule** to use for the test and run **Rate Check**.

Rate Schedule: ZZACEDEZ

5. Open the **Rate Check** result and navigate to the **Results tab**, **Read Details zone**.

Rate Check

Rate Check Results tab

Note: This issue reproduces in **C2M/CCS**. In **C2M dev**, replication was achieved by following Support's steps to reproduce (Feature Configuration ***C2M-FTOPTION*** "***Allow Eight Decimals on SQI for Internal Computation***" set to ***Y***). In **CCB**, replication is not possible by following Support's steps to reproduce. Screenshots and fix verification in this document are from **C2M 26.4**.

Solution Design

The fix is implemented in the translated Java routine ***RateApplicationProcessorService***. Two methods that populate the **Rate Check** result payload are updated:

1. ***createList_READ_LIST***

   For each read, the measured quantity and register quantity are read from the **Bill Segment Read DTO**. If either value has a scale greater than 6, it is replaced with the result of ***RoundingHelper.scaleFullValue*** for the appropriate field name (***MSR_QTY***, ***FINAL_REG_QTY***), so that the value passed to the **GTT** has at most 6 decimal places.

2. ***createList_SQ_LIST***

   For each service quantity, the billable service quantity and initial service quantity are read from the **Bill Segment Service Quantity DTO**. If either has a scale greater than 6, it is replaced with the result of ***RoundingHelper.scaleFullValue*** for ***BILL_SQ*** and ***INIT_SQ*** respectively.

No database schema changes, admin table changes, or UI changes are required. The change is limited to the Java service that builds the read and **SQ lists** for **Rate Check** so that the data conforms to the existing **GTT** scale of 6.

Summary

Change Type	Y/N
Does this fix require any Admin (Soft) Table Changes to be made by the client?	N
Does this fix require upgrade data changes to be applied?	N
Does the fix involve DB Changes?	N
Is there an impact on any user interface or any other on-line behavior?	N
Is there an impact on any batch process?	N
Is there an impact on CM – Custom Modification processing?	N
Does this fix require an application viewer update for Algorithm data (run F1-AVALG)?	N
Does this fix require an application viewer update for MO data (run F1-AVMO)?	N
Does this fix require an application viewer update for Table data (run F1-AVTBL)?	N

Translated Java Routines

RateApplicationProcessorService - Round read and service quantity values to 6 decimal places before GTT insert

Business Rules

- Before adding read rows to the **Rate Check** result payload, ensure measured quantity and register quantity have at most 6 decimal places by rounding with ***RoundingHelper.scaleFullValue*** when scale exceeds 6.
- Before adding service quantity rows to the **Rate Check** result payload, ensure billable service quantity and initial service quantity have at most 6 decimal places by rounding with ***RoundingHelper.scaleFullValue*** when scale exceeds 6.

Other Changes

Not applicable.

Required Data Changes

Not applicable.

Impact On Other Business Processes & Configuration

- The fix only affects the **Rate Check** flow when read and service quantity data are built for the result payload. No other business processes or configuration are changed.
- Environments that do not enable ***Allow Eight Decimals on SQI for Internal Computation*** are unaffected in behavior; values already at 6 or fewer decimal places are not modified.
- When the feature is enabled, **Rate Check** will no longer fail with ***"Scale of provided number exceeds maximum scale 6"*** when 8-decimal SQI values are present; they will be rounded to 6 decimals before **GTT** insert, consistent with the product's stated behavior that SQI is persisted with 6 decimal positions.

Data Clean-Up / Fixes

Not applicable.

Recommended Test Cases

Test Case 1: Rate Check with 8-decimal SQI feature enabled (Reported Issue)

- Refer to Steps to Recreate.

Expected behaviour: Rate Check completes successfully, **Read Details** loads without errors, and 8-decimal values are rounded to 6 decimals before **GTT** insert.

Test Case 2: Rate Check with 8-decimal feature disabled

- Refer to Steps to Recreate.
- Set the feature option ***"Allow Eight Decimals on SQI for Internal Computation"*** to ***N***.

Expected behaviour: Rate Check completes successfully and displays values unchanged.
