Reported Issue

Description

This enhancement is to backport the below features from 26.4 to 25.10 version.

1. We can associate a Service Point to a Weather Data source using a weather source identifier, enabling standardized access to weather data across DACS and MDM. By leveraging a weather source identifier stored on the Service Point, the system will dynamically resolve and link to the appropriate weather data channel. The primary goal is to ensure consistent weather data mapping for use in estimation, billing, and settlement workflows.
2. SP Network Location Inbound Sync Request. This inbound sync request stages the assignment or update of transformer to a service point. Sync request will created from the upload job. Assumption is that the incoming service point which is the CIS SP already exists and for an electric service type. Inbound transformer must also exist. This is changed to include the external weather station.

Steps To Recreate

Solution Design

Summary

Change Type	Y/N
Does this fix require any Admin (Soft) Table Changes to be made by the client?	N
Does this fix require upgrade data changes to be applied?	N
Does the fix involve DB Changes?	N
Is there an impact on any user interface or any other on-line behavior?	Y
Is there an impact on any batch process?	N
Is there an impact on CM – Custom Modification processing?	N
Does this fix require an application viewer update for Algorithm data (run F1-AVALG)?	N
Does this fix require an application viewer update for MO data (run F1-AVMO)?	N
Does this fix require an application viewer update for Table data (run F1-AVTBL)?	N
