Reported Issue

Description

When running the Asset Monitor Batch Control with more than one thread, the status shows the number of records processed as more than the records that should be processed.

Steps to Recreate

Data Requirements

- Asset records to be processed for a specific Asset Type. Search for the Assets with this Asset Type in the application or from the database.

Steps Scenario 1

Navigate to the Batch Job Submission by navigating to Main Menu, Tools, Batch Job Submission. Add or search for an existing Batch Code W1-ASSET and duplicate the record. Add the Asset Type Batch Job Parameter to limit the number of records processed since too many records may take an excessive amount of time. Within the Main section, specify a thread count of at least 2. Click Save to start the Batch Job Submission.

Expected Results for Scenario 1

The status of the Batch Run shows the number of Processed Records the same as number of asset records with the Asset Type from Data Requirements. From the Batch Run portal, Threads tab, the total number of records processed across all threads is the same as the total number of asset records.

Actual Results for Scenario 1

The status of the Batch Run shows the number of Processed Records the same as twice the number of asset records with the Asset Type from Data Requirements. From the Batch Run portal, Threads tab, the total number of records processed across all threads is twice as much as the total number of asset records.

Investigation

Problem Cause

Within the backing Java program for the Batch Control, the query to retrieve the Asset records was missing the filter for the low and high values. This filter is used by Framework logic to specify the range of records to process for the thread.

Suggested Solution

Modify the backing Java program to include the low and high filters.

Solution Design

Summary

Change Type	Y/N
Does this fix require any Admin (Soft) Table Changes to be made by the client?	N
Does this fix require upgrade data changes to be applied?	N
Does the fix involve DB Changes?	N
Is there an impact on any user interface or any other on-line behavior?	N
Is there an impact on any batch process?	Y
Is there an impact on CM – Custom Modification processing?	N

Detailed Changes

Batch Control (Java)

com.splwg.w1.domain.assetManagement.asset.batch.AssetAutoTransitionBatchProcess (update): Updated the SQL and thread processing to include the low and high values.

Recommended Test Cases

Test Case 1

Repeat the steps from "Steps to Recreate".
