Description
Steps To Recreate

Description

In fixed-position extract files, space padding is applied based on byte length rather than character count.
When the data contains multilingual characters (for example, Chinese), this results in fields not occupying the expected number of character positions.

As a result, although the extract completes successfully, the output file may appear visually misaligned when reviewed, leading to concerns about field positioning.

Steps To Recreate

1.Configure an extract batch using a fixed-position format (FIXD).

2.Populate one or more fields of table being queried with multilingual (Unicode) characters.

3.Run the extract to generate the output file.

4.Review the generated file in a text editor.

Output:
The column containing multilingual characters ends before its expected position.

Summary
FW Changes

Summary

Change Type	Y/N
Does this fix require any Admin (Soft) Table Changes to be made by the client?	N
Does this fix require upgrade data changes to be applied?	N
Does the fix involve DB Changes?	N
Is there an impact on any user interface or any other on-line behavior?	N
Is there an impact on any batch process?	N
Is there an impact on CM – Custom Modification processing?	N

FW Changes

1.Introduced a new extract batch fileFormat parameter value: FIXC (Fixed by Characters).

2.Existing fixed-position behavior remains unchanged.

3.FIXC can be used when extracts include multilingual characters.

In addition, we 'dat' has been added to the allowlist for file extensions (Managed Content). As part of this update, two extensions requested by a different bug were also included: 'exp' and 'corccb'.

Recommended Test Cases

1.Generate a fixed-position extract with ASCII-only data.

2.Generate a fixed-position extract using FIXC with multilingual data.

3.Verify that each field occupies the defined number of character positions.

4.Confirm that record structure and field boundaries are correct in the output file.
